

Garson, James (2006). *Modal Logic for Philosophers*, ch. 3.

### Exercise 3.1

a) If  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(A \rightarrow B)=T$ , then  $\mathbf{a_w}(B)=T$

1. Presume  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(A \rightarrow B)=T$ .
2. Then  $\mathbf{a_w}(A)=F$  or  $\mathbf{a_w}(B)=T$
3. But  $\mathbf{a_w}(A)=T$
4. So  $\mathbf{a_w}(B)=T$
5. Therefore, if  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(A \rightarrow B)=T$ , then  $\mathbf{a_w}(B)=T$

A	
A $\rightarrow$ B	
$\sim A$	B

b) If  $\mathbf{a_w}(A \rightarrow B)=T$  and  $\mathbf{a_w}(B)=F$ , then  $\mathbf{a_w}(A)=F$

1. Presume  $\mathbf{a_w}(A \rightarrow B)=T$  and  $\mathbf{a_w}(B)=F$ .
2. Then  $\mathbf{a_w}(A)=F$  or  $\mathbf{a_w}(B)=T$
3. But  $\mathbf{a_w}(B)=F$
4. So  $\mathbf{a_w}(A)=F$
5. Therefore, if  $\mathbf{a_w}(A \rightarrow B)=T$  and  $\mathbf{a_w}(B)=F$ , then  $\mathbf{a_w}(A)=F$

A $\rightarrow$ B	
$\sim B$	
$\sim A$	B

c)  $\mathbf{a_w}(A \& B)=T$  iff  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$ .

To show that if  $\mathbf{a_w}(A \& B)=T$ , then  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$

1. Presume  $\mathbf{a_w}(A \& B)=T$
2. Then  $\mathbf{a_w}(\sim(A \rightarrow \sim B))=T$
3. So  $\mathbf{a_w}(A \rightarrow \sim B)=F$
4. So  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(\sim B)=F$
5. That is,  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$
6. Therefore, if  $\mathbf{a_w}(A \& B)=T$ , then  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$

A & B	
$\sim(A \rightarrow \sim B)$	
A	
$\sim \sim B$	
B	

To show that if  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$ , then  $\mathbf{a_w}(A \& B)=T$ :

1. Presume that  $\mathbf{a_w}(A \& B)=F$
2. Then  $\mathbf{a_w}(\sim(A \rightarrow \sim B))=F$
3. So  $\mathbf{a_w}(A \rightarrow \sim B)=T$
4. So  $\mathbf{a_w}(A)=F$  or  $\mathbf{a_w}(\sim B)=T$
5. That is,  $\mathbf{a_w}(A)=F$  or  $\mathbf{a_w}(B)=F$
6. So if  $\mathbf{a_w}(A \& B)=F$ , then  $\mathbf{a_w}(A)=F$  or  $\mathbf{a_w}(B)=F$
7. So by contraposition, if neither  $\mathbf{a_w}(A)=F$  nor  $\mathbf{a_w}(B)=F$ , then  $\mathbf{a_w}(A \& B) \neq F$ .
8. That is, if  $\mathbf{a_w}(A)=T$  and  $\mathbf{a_w}(B)=T$ , then  $\mathbf{a_w}(A \& B)=T$

$\sim(A \& B)$	
$\sim \sim(A \rightarrow \sim B)$	
A $\rightarrow \sim B$	
$\sim A$	$\sim B$

### Exercise 3.2

Show that the following v diagram rules follow from the rules for  $\sim$  and  $\rightarrow$

A v B	
A	B

$\sim(A v B)$	
$\sim A$	
$\sim B$	

For the first:

1. Let  $\mathbf{a_w}(A v B)=T$

2. Then  $\mathbf{a}_w(\sim A \rightarrow B) = T$
3. Then  $\mathbf{a}_w(\sim A) = F$  or  $\mathbf{a}_w(B) = T$
4. That is,  $\mathbf{a}_w(A) = T$  or  $\mathbf{a}_w(B) = T$

For the second:

1. Presume  $\mathbf{a}_w(A \vee B) = F$
2. Then  $\mathbf{a}_w(\sim A \rightarrow B) = F$
3. So  $\mathbf{a}_w(\sim A) = T$  and  $\mathbf{a}_w(\sim B) = T$
4. That is,  $\mathbf{a}_w(A) = F$  and  $\mathbf{a}_w(B) = F$

### Exercise 3.3

a) for the following diagram rule for  $(\Diamond F)$ , draw diagrams for **before** and **after** the rule is applied.

$(\Diamond F)$  if  $\mathbf{a}_w(\Diamond A) = F$  and  $\mathbf{wRv}$ , then  $\mathbf{a}_v(A) = F$

**Before**

↓

□<sub>v</sub>

**After**

↓

b) show that  $(\Diamond F)$  follows from  $(\Box)$ ,  $(\sim)$ , and  $(\text{Def}\Diamond)$  using diagrams

### Exercise 3.4

a) Show that  $|=_{\mathbf{K}} A$  iff for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,

$\mathbf{a}_w(A) = T$

1. First, we show that if  $|=_{\mathbf{K}} A$ , then for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ .
2. Presume  $|=_{\mathbf{K}} A$
3. Then the argument  $/A$  is K-valid
4. That is,  $/A$  has no K-counterexample
5. So  $\sim A$  is not K-satisfiable
6. That is, for a language containing  $\sim A$ , there is no model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and a world  $\mathbf{w}$  in  $\mathbf{W}$  where  $\mathbf{a}_w(\sim A) = T$
7. So for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(\sim A) = F$
8. That is, for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$
9. Therefore, if  $|=_{\mathbf{K}} A$ , then for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ .
10. Next, we show that if for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ , then  $|=_{\mathbf{K}} A$
11. Presume  $| \neq_{\mathbf{K}} A$
12. Then  $/A$  is not K-valid
13. Then  $/A$  has a counterexample
14. Then  $/\sim A$  is K-satisfiable
15. That is, there is a K-model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  such that for some  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(\sim A) = T$
16. So there is a K-model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  such that for some  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = F$
17. That is, it is not the case that for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ .
18. Thus, if  $| \neq_{\mathbf{K}} A$ , then it is not the case that for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ .
19. So by contraposition, if for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$ , then  $|=_{\mathbf{K}} A$
20. Therefore,  $|=_{\mathbf{K}} A$  iff for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a}_w(A) = T$

b) Show that  $H| =_{\mathbf{K}} A$  iff for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a}_w(H) = T$ , then  $\mathbf{a}_w(A) = T$

1. First, we show that if  $H| =_{\mathbf{K}} A$ , then for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$

and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(A)=T$ .

2. Presume  $H \models_K A$
3. Then the argument  $H/A$  is K-valid
4. That is,  $H/A$  has no K-counterexample
5. So the list  $H, \sim A$  is not K-satisfiable
6. That is, for a language containing  $\sim A$ , there is no model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and a world  $\mathbf{w}$  in  $\mathbf{W}$  such that  $\mathbf{a_w}(H)=T$  and  $\mathbf{a_w}(\sim A)=T$
7. So for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(\sim A)=F$
8. That is, for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(A)=T$
9. Therefore, if  $H \models_K A$ , then for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(A)=T$ .
10. Next, we show that if for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(A)=T$ , then  $H \models_K A$
11. Presume  $H \not\models_K A$
12. Then  $H/A$  is not K-valid
13. Then  $H/A$  has a counterexample
14. Then the list  $H, \sim A$  is K-satisfiable
15. That is, there is a K-model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  such that for some  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a_w}(H)=T$  and  $\mathbf{a_w}(\sim A)=T$
16. So there is a K-model  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  such that for some  $\mathbf{w}$  in  $\mathbf{W}$ ,  $\mathbf{a_w}(H)=T$  and  $\mathbf{a_w}(A)=F$
17. That is, it is not the case that for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$  then  $\mathbf{a_w}(A)=T$ .
18. Thus, if  $H \not\models_K A$ , then it is not the case that for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$  then  $\mathbf{a_w}(A)=T$ .
19. So by contraposition, if for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$  then  $\mathbf{a_w}(A)=T$ , then  $H \models_K A$
20. Therefore,  $H \models_K A$  iff for all models  $\langle \mathbf{W}, \mathbf{R}, \mathbf{a} \rangle$  and all  $\mathbf{w}$  in  $\mathbf{W}$ , if  $\mathbf{a_w}(H)=T$ , then  $\mathbf{a_w}(A)=T$

c) Create a diagram that shows that  $H \not\models_K C$ , that is, that the argument  $H/C$  has a K-counterexample

H	
C	$\sim C$
